| Date | August 31, 2011 |
| Applies To | Kofax Monitor 6.5 |
| Summary | This application note provides instructions on opening and configuring Kofax Monitor 6.5 Log Management. |
| Revision | 1.0 |

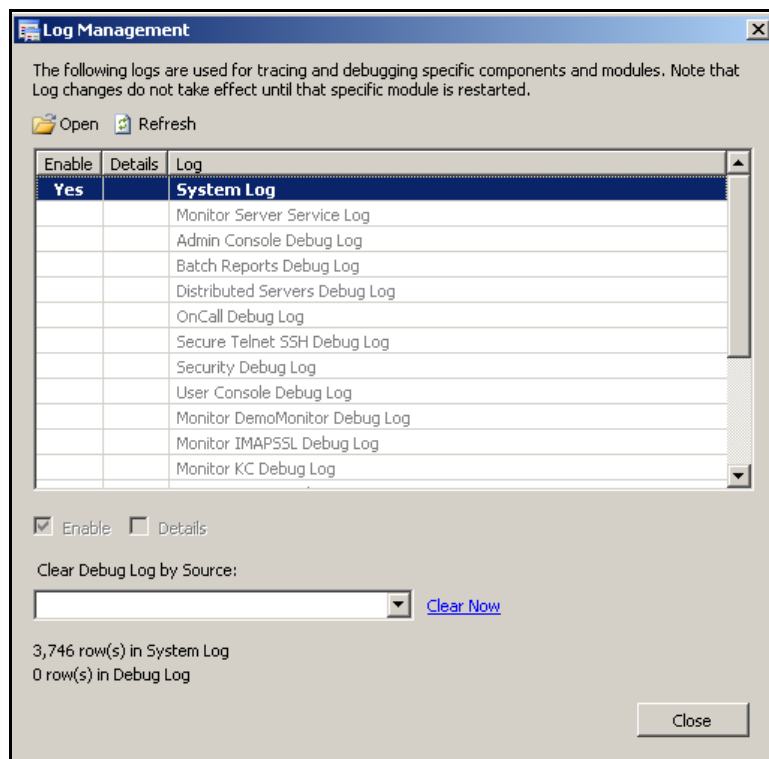

Kofax Monitor 6.5 Log Management

The Log Management window enables you to do the following:

- Enable a selected log.
- Disable a selected log.
- View a selected log.
- Clear a selected debug log.
- Change the settings for a selected log.
- Refresh a selected log.
- Refresh the display.

Steps to Open Kofax Monitor Log Management

To open Kofax Monitor Log Management, go to the **Kofax Monitor Admin Console**, click on the  icon or choose Log Management from the Log menu. The Log Management window will open.

Kofax Monitor Log Management Window

The Kofax Monitor System Log is always on and contains information and error messages from your entire Kofax Monitor system. User activities are also kept in the Kofax Monitor System Log.

All of the other logs are debug logs, and can be turned on when diagnosing an issue. As a default, these logs should be turned off since they can be verbose and affect system performance.

To enable and disable a log for debugging purposes, complete the following steps:

1. Open the Kofax Monitor Log Management window ([see steps above](#)).
2. Select a log other than the Kofax Monitor System Audit Log.
3. Select Enable.
4. Select Details if additional details are desired to debug an issue, or when Kofax Support requests a detailed log.

IMPORTANT NOTE: Enabling or disabling some of the Kofax Monitor logs might not take place until the specific program is restarted.
